ICT – Connecting China and the World

Information and Communication Technology (ICT) has been going through extensive growth and advancement in recent years, bringing profound and major impacts to political, economic and social aspects of the global society. Innovation and development in ICT has indeed played a highly significant role in connecting China and the world.

Since the reform and opening up of China, the Chinese government has attached

strong importance to the development of ICT, adopting the strategy of combining the introduction, the assimilation and the innovation of technologies, enabling progress in industry development by leaps and bounds. The global ICT industry is now on the eve of transition towards the next-generation networks, presented with a historical wealth of opportunities to be reaped for further development. At the same time, the ICT industry is facing the enormous challenges of maintaining sustainable, healthy and rapid growth under the new circumstances, reshaping its landscape while undergoing fundamental transformation to the way the telecommunication industry is developing.

China's ICT industry has achieved major progress in international exchange and cooperation, positively enabling further growth and development. The vast market potential, the richness in human resources and the constant improvement in the investment environments have attracted a large number of multi-national companies to China for investments and collaboration, taking active parts in building the Chinese ICT industry.

Under the strategy of going global, more and more Chinese ICT companies have proactively developed their overseas markets, acquiring broad exposure and experience while achieving remarkable growth in the international market.

Throughout the process, moreover, enhancement in creativity has constituted a key driving force behind sustainable healthy development. The extensive applications of ICT in national economic and social arenas are providing much broader space for industry growth. The emergence of new technologies and new businesses have hence largely contributed to China's actualisation of "informatisation driving industrialisation, and industrialisation enhancing informatisation", leading towards the development of a harmonious economic society.

Remarks:

Language of Presentation: English or Putonghua

Simultaneous Interpretation Services: English, Putonghua, Cantonese
